

Cryptostick initialization

This manual will explain how to initialize cryptostick. In most cases this action is needed if cryptostick PUK code is lost. **This action will delete all information on the stick, including all certificates and keys.**

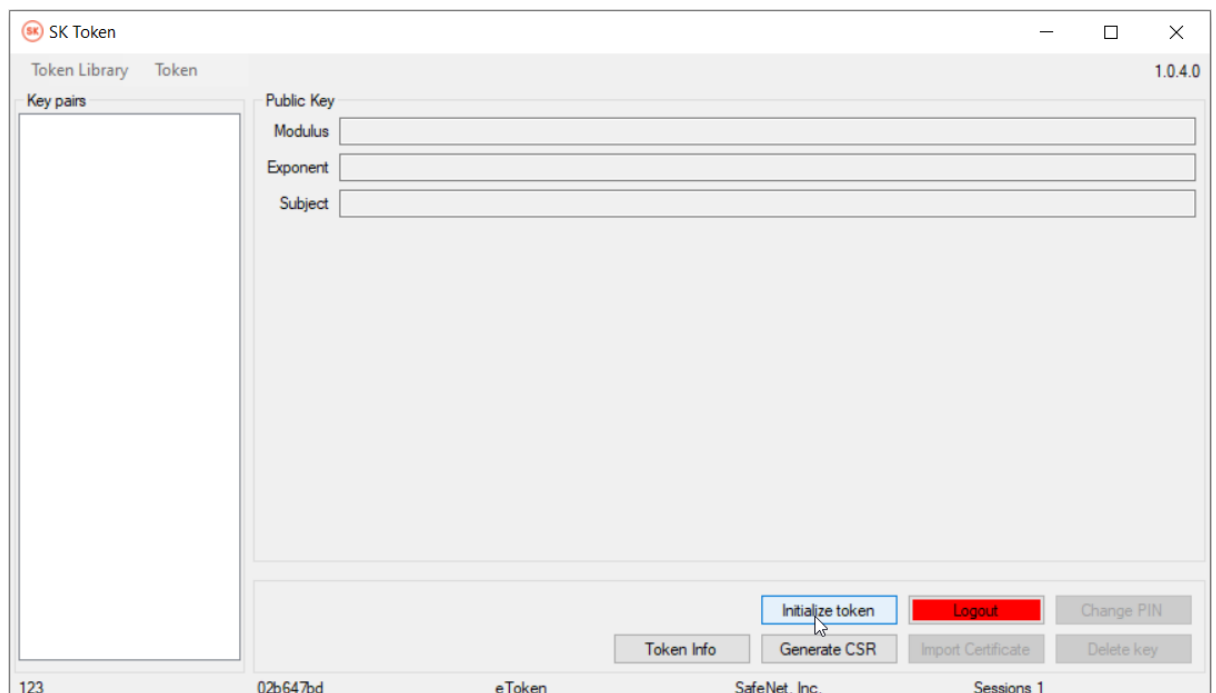

SK Tokenit can be downloaded from [here](#)

Initialization

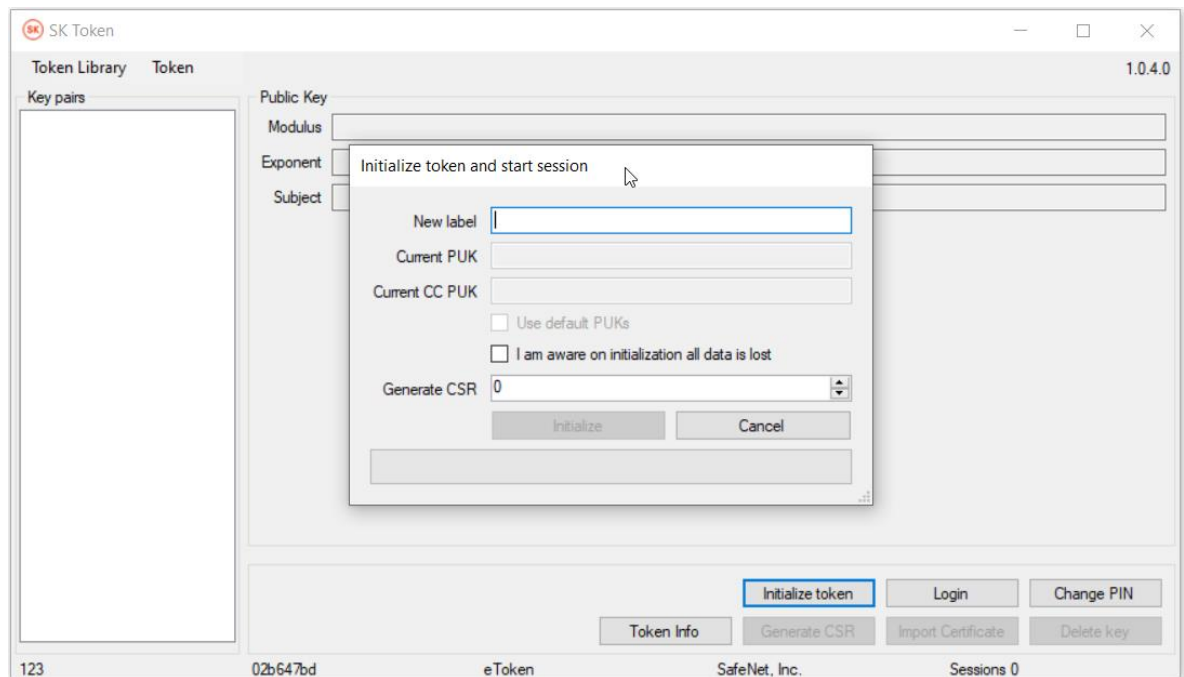

1. Open SK Token application, click **Token library** and select **Gemalto eToken FIPS**

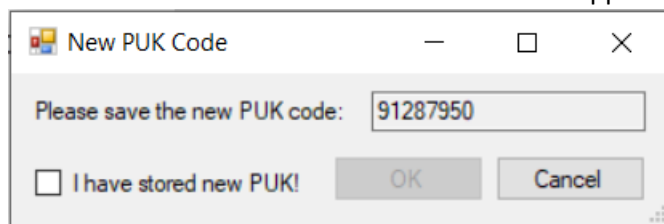

2. Select **Initialize token**

3. New window will open, where you can name the cryptostick (New label). Tick the box for “**I am aware on initialization all data is lost**” and select **Initialize**.

4. After that new window with new PUK code will appear.

5. Once the new password is saved, add tick and select **OK**, after that the cryptostick is initialized.

If you face issues – please send e-mail with description and if possible, a screenshot to support@skidsolutions.eu or in urgent case call +372 610 1883
